                                                                were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from pools of 5.000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. Clones 260232-265223, 3040488-345479, and 46488-84479.

The library was constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dry primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digsted with Not I, and cloned directionally into pT773-Pac vector. The oligonachectide used to prime the prime contains and prime containing a strander containing a magnetic purpose of the prime that prime containing a prime prime containing a prime p
